5. What should I know while Bupivacaine with Adrenaline Injection is being used?
6. Are there any side effects?
7. Product details

medicines known as local anaesthetics.

Bupivacaine with Adrenaline Injection is used to prevent or relieve pain, but it will not put you to sleep. It is also used after surgery to relieve pain and to make childbirth less painful.

Depending on the amount used, Bupivacaine with Adrenaline Injection will either totally stop pain or will cause a partial loss of feeling. When injected it makes the nerves nearby unable to pass messages to the brain and will therefore prevent or relieve pain.

Your doctor will have explained why you are being treated with Bupivacaine with Adrenaline Injection and what dose you will be given.

Follow all the directions and advice given to you by your doctor carefully.

Your doctor may have prescribed Bupivacaine with Adrenaline Injection for uses other than those listed above.

1. Why is Bupivacaine with Adrenaline Injection being used?

Bupivacaine with Adrenaline Injection contains the active ingredients bupivacaine hydrochloride (as monohydrate) and adrenaline (epinephrine) (as acid tartrate).

Bupivacaine with Adrenaline Injection belongs to a group of
