1. Why am I using LYZALON?

LYZALON contains the active ingredient pregabalin.

LYZALON belongs to a group of medicines called anticonvulsants. These medicines are thought to work by controlling brain chemicals which send signals to nerves so that seizures do not happen. LYZALON also has pain relieving effects.

LYZALON is used to treat neuropathic pain, which is pain caused by an abnormality of, or damage to, the nerves.

LYZALON is also used to control epilepsy. Epilepsy is a condition where you have repeated seizures (fits). There are many different types of seizures, ranging from mild to severe.

LYZALON may be used alone, or in combination with other medicines, to treat your condition.

Your doctor may prescribe LYZALON in addition to your current therapy when your current treatment is no longer working as well as before.

Ask your doctor if you have any questions about why this medicine has been prescribed for you.

Your doctor may have prescribed it for another reason.

Use in Children

There is not enough information to recommend the use of this medicine in children under the age of 18 years.
