1. Why am I taking ALENDRONATE-WGR?

ALENDRONATE-WGR contains the active ingredient alendronate sodium trihydrate. Alendronate sodium trihydrate belongs to a group of medicines called bisphosphonates.

ALENDRONATE-WGR is used to treat osteoporosis.

Osteoporosis is a disease which causes bones to become more porous, gradually making them

weaker, more brittle and likely to break.

Understanding Bone

Bone is living, growing tissue. Throughout life, our bodies are breaking down old bone and rebuilding new bone in a continuous cycle.

How it Works

Alendronate sodium trihydrate works by slowing down the process of old bone being removed, which allows the bone-forming cells time to rebuild normal bone. Alendronate sodium trihydrate helps prevent the loss of bone and helps to rebuild bone, making bone less likely to break. This helps to prevent or reverse the progression of osteoporosis.
