1. Why am I taking Pomolide?

Pomolide contains the active ingredient pomalidomide. Pomolide belongs to a group of medicines called immunomodulating agents.

Pomolide is used in combination with another medicine called 'dexamethasone' (steroid medicine) to treat adult patients diagnosed with Multiple Myeloma. (MM) (a cancer of the bone marrow). It is prescribed for patients whose disease has progressed after two prior therapies.

Pomolide is also used in combination with dexamethasone and another medicine called 'bortezomib' to treat adult MM patients whose disease has progressed after one therapy.
